### Visionary technology

tearcheck® allows quick and easy examinations, as in total 8 exams can be done in less than 10 minutes, report included. Two high-resolution cameras inside provide perfect capture of images and videos. White, blue and infrared light are used to perform the different exams within a self-explaining process guiding you through.

A patented new way to evaluate tearfilm stability on the whole cornea, by using a line mask, is provided by two exams, which are done within one recording (TFSE®/NIBUT).

Also patented is the exam to evaluate the degree of inflammation on the ocular surface (OSIE®).

## Be inspired by the innovation

disruptive product fully dedicated to dry eye syndrome and capable of constantly evolving, that was my intention behind developing tearcheck®.

Dr. Yves Vincent BROTTIER Creator of tearcheck®

#### (Non-Invasive Breakup-Time)

Shows the ruptures in the tear film already from two seconds on, based on highly sensitive detection. Recorded within TFSE® exam.

A new kind of exam to evaluate the **surface of the tear film** three-times per second. Specifically designed optimised horizontal lines replace the traditional circular pattern.

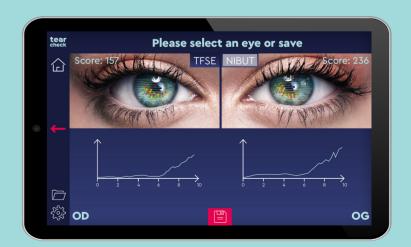

#### **TFSE®**

#### (Tear Film Stability Evaluation)

Makes it possible to assess the micro-deformations appearing on the surface of the tear film. These **micro-deformations** reflect instability of the tear film. They are presented in number and in intensity (score and diagram). And recorded within 10 seconds.

#### Meibography

(2D/3D)

Makes it possible to visualize the Meibomian glands in 2D/3D imaging. The results help to evaluate the rate of gland loss (in %) and the morphology of the glands present. A special eyelid flipping tool is used to allow touch-free examination.

This examination captures images of the bulbar and palpebral conjunctivae. It makes it possible to assess hyperemia induced by the inflammatory phenomena consecutive to dry eye syndrome and to monitor its progress over the treatments delivered to the patient.

#### Demodex

The Demodex exam consists of an enlarged image capture of the base of the eyelashes.

The magnification factor of the image makes it possible to find and visualize the signs of the presence of the parasite.

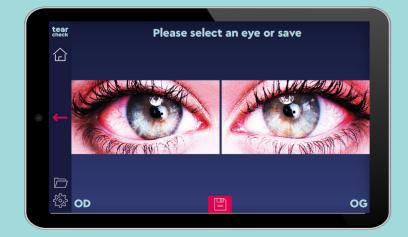

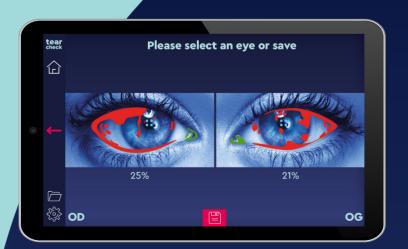

#### **OSIE®**

#### (Ocular Surface Inflammatory **Evaluation**)

The principle behind this examination resides in the fact that fluorescein will remains "attached" to areas of the eyeball exhibiting surface alteration in connection with an inflammatory process in the case of Dry Eye syndrome.

10

#### Tear Meniscus

Is evaluated in the lower eye lid and is showing, if there is sufficient tear production before the next eye blinking.

#### **OSDI**

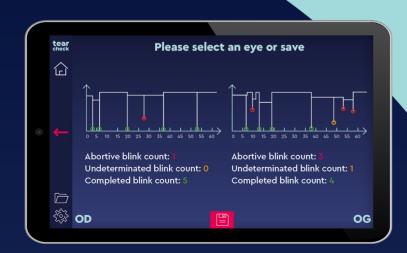

#### (Ocular Surface Disease Index)

A questionnaire intended to be filled out by the patient, reflecting their subjective feeling and opinion on their visual comfort in their daily life.

#### Abortive Blinking

Within 60 seconds, all blinks are recorded for automatic detection of incomplete blinking.

12

#### Reports

The whole reports per patient will be stored. This makes it possible to compare different results from same examination or to regard all selected exams. Report history can be filtered by date or by exam.
